

AI Usage Report – PHP MVC Project

Project: [Your Project Name]

Student(s): [Your Name(s)]

Course requirement: Complete the table below for every major AI assistance (code generation, debugging, SQL design, explanation of concepts).

How to use this document

1. Each time you ask the AI for help, **immediately copy/paste** the exchange into the table.
2. Add your **critical analysis** – what did you change? Why? Did the AI suggest something wrong?
3. Write a **justification** – why did you need AI here? (e.g., “first time using Singleton”, “debugging a foreign key error”)
4. Keep the table in chronological order. One row per *major* assistance (no need for trivial typos).

Reporting Table

Prompt (what you asked)	AI Response (code / explanation)	Critical Analysis & Adjustments (what you modified/fixed)	Justification (why AI was used)
<i>Ex: “Create a PHP Database class using Singleton pattern with PDO”</i>	<i>Ex: [paste the AI’s code]</i>	<i>Adapted to use UTF-8, added persistent connection option, renamed method <code>getInstance()</code> to follow project conventions.</i>	<i>Required robust, single database connection across MVC – unfamiliar with Singleton implementation.</i>
<i>... add rows as you work ...</i>			

Examples of what to log (non-exhaustive)

- **Generating SQL schema (Unit 0)** – tables, foreign keys, sample data
- **Writing the Database singleton (Unit 1)** – PDO options, error handling
- **Entity classes (Unit 2)** – property mapping, getters/setters, hydration
- **DAO classes (Unit 3)** – CRUD methods with prepared statements

- **Router & front controller (Unit 4)** – URL parsing, 404 handling
- **Authentication module (Unit 5)** – login/logout, session protection, password verification
- **CRUD controller & views (Unit 6)** – form handling, CSRF tokens
- **Uploader class (Unit 7)** – file validation, unique naming
- **File management module (Unit 8)** – database table for files, admin UI
- **Search module (Unit 9)** – multi-criteria, pagination, safe LIKE queries
- **Debugging any error** – white screen, PDO exception, session loss, path issues

Example of a complete row (realistic)

Prompt	AI Response	Critical Analysis & Adjustments	Justification
“Write a <i>ProductDao.php</i> with <i>find(id)</i>, <i>findAll()</i>, <i>save(product)</i>, <i>delete(\$id)</i>. Use the Database singleton. Here is my <i>Product</i> entity and the table schema.”	[AI returns code with <i>findAll()</i> using <i>fetchAll(PDO::FETCH_CLASS)</i> and <i>save()</i> checking <i>\$product->getId()</i>]	1. Changed <i>FETCH_CLASS</i> to manual hydration because my entity constructor requires parameters. 2. Added <i>lastInsertId()</i> return in <i>save()</i> for insert. 3. Fixed column name mismatch: <i>product_image</i> in DB vs <i>image_path</i> in entity – remapped.	First time v DAO with dynamic INSERT/UPDATE. Wanted to avoid SQL errors: see proper prepared statement patterns.

Final reminder before submission

- The **final PDF** (cahier des charges) must contain **this table** (copy the rows).
- Do **not** include trivial interactions (“fix a missing semicolon”) – only major design, debugging or generation steps.
- Be honest: the evaluator wants to see **critical thinking**, not perfect AI code.

Last update: [date]

Total AI interactions recorded: [number]
